

N-PORT Final Operating Audit

What the system uses now, what remains open, and exactly where each issue is fixed

Operating date: August 4, 2026

Executive conclusion

The immediate input error was caused by instructions that required a nonexistent per-fund positions.csv. That was the wrong workflow for this repository. The working monthly path is custodian + EagleSTAR + create/redeem, followed by Bloomberg and one centralized human-review workbook.

Current file selection

Input	Selected file	Observed cutoff	Role
Custodian	data/custodian/Corgi_Adv.40C8.C8 ETF_Holdings (1).csv	2026-06-25	Filing input
EagleSTAR	data/fund_accounting/takeout-20260625T000453Z-3-001.zip	2026-06-24	Filing input
Create/redeem	data/orders/HistoricalOrders (83).csv	through 2026-06-24	Reconciliation control
Report date	2026-06 filing	2026-06-30	Target

Time-series finding

The current sources are not period-end aligned: custody is June 25, EagleSTAR is June 24, create/redeem ends June 24, and the filing date is June 30. Therefore the current numerical differences are not a valid final apples-to-apples period-end comparison. They remain open until period-end files are loaded or the filing period is changed to match the source cutoff.

Current open items

Open item	Measured state	Exact place to fix	Resolution
Swap payment-leg spread	58 of 58 swap review rows are blank for pmntFloatingRtSpread.	data/humanreview/2026-06_review.xlsx -> swap_legs -> pmntFloatingRtSpread	Enter the actual spread from each executed swap confirmation; then rerun mergehumanreview.
Flow reconciliation	238 REVIEW rows: 216 sales and 22 redemptions across mon1-mon3.	Replace/update data/orders/ and/or data/fund_accounting/; then rerun masters.	Align both sources to the same report cutoff and investigate remaining differences. Do not overwrite EagleSTAR filing values with order-book values.
Net-assets reconciliation	19 REVIEW rows.	Replace/update data/custodian/ and/or data/fund_accounting/; then rerun masters.	Use matching as-of dates first; investigate only the residual breaks.
Liability reconciliation	1 REVIEW row.	Correct the EagleSTAR mapping/source in data/fund_accounting/ or the accounting adapter; then rerun masters.	Confirm mapped payable accounts equal the EagleSTAR total-liabilities control.
Fund policy	data/master/fund_registry.csv is absent; fund_config files without policy fields cannot release.	Per fund: fund_config.txt fields fiscalYearEndMMDD, derivativesRegimePolicy, liquidityRequired, cashB2fRequired, policyEffectiveFrom.	Enter approved fund facts. The code must not infer them.

Meaning of missing versus blocking

Term	Meaning	Action
Missing	An applicable value is absent and the system has a known entry location.	Enter it in the named human-review cell or correct the named input.
Blocking	The system must not release XML because an applicable value, policy fact, reconciliation, or validation is unresolved.	Resolve the underlying issue. A blocker is a state, not a separate file type.
Reconciliation REVIEW	Two controls disagree or their dates are not aligned.	Fix/replace source inputs and rerun. It is not a blank field to type over.

Verified operating boundary

Prepared N-PORT XML and other reference filings remain comparison-only. The restored masters command no longer reads data/RealXMLs. Create/redeem orders remain a control only. The command prints selected inputs before writing, which makes an accidental file selection visible.

Remaining engineering gap

The monthly human-review workbook centralizes residual security and derivative fields, but fund policy is still stored per fund and reconciliation exceptions are still resolved upstream. That is the current code behavior. It would be inaccurate to claim every blocker can be cleared inside the human-review workbook today.
