

N-PORT Runbook

One input path, one human-review workbook, one build sequence

Operating date: August 4, 2026

The only monthly input folders

Do not create **positions.csv**. Put the files already received into these folders.

Input	Folder	What it does
Custodian positions	data/custodian/	Creates the holdings population and supplies custody position and valuation fields.
EagleSTAR	data/fund_accounting/	Supplies fund-accounting totals, gains, liabilities, flows, and derivative unrealized amounts when present.
Create/redeem	data/orders/	Reconciles EagleSTAR subscription/redemption flows. It is a control; it does not overwrite filing values.
Bloomberg	Open the two master workbooks	Calculates the formulas inserted for returns, durations, and supported security-reference fields.
Human review	data/humanreview/<period>_review.xlsx	Holds residual values automation cannot supply. This is the only manual monthly workbook.

Front-to-end commands

1. Load the received files

```
& ".\env\Scripts\nport.exe" masters 2026-06
```

The command prints the exact custodian, EagleSTAR, and create/redeem paths selected. Stop if any path is wrong.

2. Let Bloomberg calculate

```
Open data\master\security_master.xlsx
Open data\master\filing_master.xlsx
```

Use Excel on the Bloomberg machine. Wait for formulas to return values, then save and close both workbooks.

3. Generate the residual review

```
& ".\env\Scripts\nport.exe" mergehumanreview 2026-06
```

Open data\humanreview\2026-06_review.xlsx. Fill only the required blank cells reported by the command. Save and close.

4. Apply human entries

```
& ".\env\Scripts\nport.exe" mergehumanreview 2026-06
```

If required blanks are still reported, correct those exact rows and run the same command again.

5. Write each fund's files

```
& ".\env\Scripts\nport.exe" split 2026-06
```

This projects the reviewed masters into data\funds\<fund>. Do not edit those generated files before the next split.

6. Build XML

```
& ".\env\Scripts\nport.exe" build
```

Builds all funds. For one fund, run: nport build fdrs 2026-06.

What the human actually enters

Review sheet	Human entry	Rule
swap_legs	The missing executed swap-leg terms, currently including pmntFloatingRtSpread.	Use the executed confirmation. Enter 0 only when the actual spread is zero.
invCountry	Missing investment country.	Use the supported security/reference record; do not infer from name.
option_index	Missing option reference-index name and identifier.	Use the actual contract/reference instrument.
swap_counterparties	Missing legal counterparty name or LEI.	Use the executed trade/legal-entity record.
designated_index	Fund designated index when applicable.	Use the fund's approved prospectus/risk policy.
isin	Missing ISIN when available.	Optional when the filing can use another identifier.

Reconciliation flags are different

A missing review value has a cell in the review workbook. A reconciliation flag means two received sources do not agree or are not aligned. Do not type over the difference in the review workbook. Correct or replace the source file in its input folder, rerun **masters**, and review the regenerated reconciliation report.

Success check

The run is complete only when the selected input paths are correct, Bloomberg has been saved, required human-review cells are filled, reconciliation REVIEW flags are cleared for the filing, split succeeds, and build produces schema-valid XML.
