

N-PORT Filing Pipeline & Runbook

How the tool works, what the audit found, and what to do next — step by step.

Period	2026-06 (quarter ending 30 June 2026)
Funds	105 in custodian · 104 building · 1 cash-only
Status	All output marked TEST — nothing filed
Branch	humanreview-live-gate
Prepared	30 July 2026

Before you start

Both source extracts stop on **24 June**, but the filing covers through **30 June**. Nothing downstream can be trusted until they are re-pulled. That is Step 1.

1 · How the pipeline works

Three files in, one XML per fund out. Four commands, plus one trip to a Bloomberg terminal.

YOU SUPPLY

- **Custodian file** — every position, all funds (US Bank) → `data/custodian/`
- **AP order book** — every create / redeem order → `data/orders/`
- **EagleSTAR export** — the accountant's daily snapshots → `data/fund_accounting/`

1

nport masters
COMMAND

Reads all three inputs and builds **two Excel workbooks** covering every fund at once — one for holdings, one for fund-level numbers. Also writes the **provenance** and **reconciliation** reports.

2

Bloomberg terminal
MANUAL

Open both workbooks, let the `=BDP()` formulas calculate, save as `.xlsx`. This fills company IDs, country, returns and bond durations.

3

**nport
mergehumanreview**
COMMAND ×2

Lists whatever has no feed in a review spreadsheet. You fill the blanks; running it again folds your answers back in, tagged as **human-reviewed**.

4

nport split
COMMAND

Pure copying. Chops the workbooks into per-fund files. No decisions made here — which is why you **edit the workbook, never the fund files**.

5

nport build
COMMAND

Sorts each row into a type, validates every required field, checks the LIVE gate, writes the XML and validates it against the SEC schema.

YOU GET

- `output/<TICKER>_2026-06.xml` — one per fund, ready for EDGAR

The rule the design follows

Every number has exactly **one owner**. A second source never writes — it only cross-checks into the reconciliation report. Where nothing has a feed, a human fills it in and it gets tagged.

WHAT	WHO OWNS IT
Positions, share counts	Custodian
Company IDs, country, returns, durations	Bloomberg
Dollars — net assets, gains, flows	EagleSTAR accounting
Anything with no feed	Human review spreadsheet

2 · What the audit found

The plumbing is sound. All 104 files pass the SEC schema. The problems are in the data going in.

The one root cause — stale source data

Both extracts stop on **24 June**; the period ends **30 June**. This produced **238 warnings across 137 of 152 funds**, leaving only 15 clear to file.

Most of those warnings are harmless. Accounting books a trade when it *settles*; the order book records it when it is *placed*. So a trade near a month boundary lands in different months in the two systems. Add up the whole quarter and they match exactly — **232 of 304** fund/side series tie precisely.

But 16 funds are genuinely wrong

They had accepted redemptions on **24 June** that had not settled by the time the accounting snapshot was taken. Accounting is the source for flows, so those filings report **zero redemptions**. Example: XIWC redeemed **\$374,892** and the file says \$0.00.

Two code defects — now fixed

DEFECT	BEFORE	AFTER
Percentages did not tie to the total. Each holding's % came from the custodian's fund size, but the filing reports the accountant's fund size. Two denominators.	85 / 104	104 / 104
Swaps never said long or short. The field was hardcoded blank even though the direction is decoded from the ticker two lines earlier.	0 / 58	58 / 58

Both fixed, tested and pushed. The percentage check is now enforced on every build — a mismatch fails the build instead of shipping quietly. Test suite: **656 passing**.

Smaller items

ITEM	ASSESSMENT
70 option deltas blank across 18 funds	No feed exists — comes from your risk system
GPTZ will not build	Correct — it holds only a \$125k cash seed, nothing to report
Monthly returns blank for most funds	Not a gap — verified against fund inception, 104/104 consistent
7 funds show no designated index	Fill in the review spreadsheet if required
OVERVIEW.md is out of date	Predates the review step and the accounting integration

3 · What to do — step by step

Work down the list. Do not skip Step 3 — everything after it inherits the answer.

1 Get a new EagleSTAR export through 30 June

Ask for it to be re-cut with a 30 June cutoff. Save the zip into:

```
data/fund_accounting/
```

2 Get a new AP order book through 30 June

Re-export it and save as:

```
data/orders/2026-06_orders.csv
```

The custodian file is already period-end. Leave it alone.

3 Check the dates actually moved

```
nport masters --dry-run
```

If either file still stops at 24 June, **stop here**. Everything downstream inherits the problem.

4 Build the workbooks

```
nport masters
```

Look for **flows from EagleSTAR TB + EagleSTAR gains/liabilities**. If it says *no fund accounting*, the zip was not found — stop and fix that first.

5 Read the reconciliation report

```
data/master/reconciliation_2026-06.csv
```

Most warnings should now be gone. Three things to look for:

- Warnings that cancel out across two months → ignore, that is settlement timing
- A fund with order-book redemptions but zero in accounting → investigate
- **FDRS** and **FDRX** → had real \$31M / \$9.5M gaps unrelated to dates

6 Go to the Bloomberg machine

Open both workbooks, wait for them to finish calculating, then save and close Excel.

```
data/master/security_master.xlsx  
data/master/filing_master.xlsx
```

Keep them as **.xlsx** — do not "save as CSV".

7 Create the review spreadsheet

```
nport mergehumanreview
```

8 Fill in the blanks

```
data/humanreview/2026-06_review.xlsx
```

Mainly the option deltas for the 18 defined-outcome funds. Save and close.

9 Merge your answers back in

```
nport mergehumanreview
```

Yes — the same command twice. First run creates it, second run absorbs your edits.

10 Push out to the funds

```
nport split
```

11 Test the build, then build for real

```
nport build --dry-run    # writes nothing, just reports problems
nport build
```

Expect **Built 104/108**. GPTZ failing is correct — it holds only cash.

12 Check the output

```
python scripts/verify_output.py
```

You want **CLEAN 104/104**. Then open two or three XMLs in `output/` and eyeball the fund name, period and net assets.

13 Go live

Set `liveTestFlag` to `LIVE` in `filing_master.xlsx`, save, then:

```
nport split
nport build
```

14 Upload the XMLs to EDGAR

If the build refuses to go LIVE

That is the safety gate doing its job — it blocks any fund whose reconciliation still has an unresolved warning. **Do not switch it off.** If it blocks nearly everything, the gate needs retuning to ignore the harmless month-shuffle warnings; ask before overriding.

Right now

Do Steps 1 and 2. Nothing else can move until those two files arrive.
